PROFILE

Java backend engineer delivering production software for a leading global consumer-goods company on an Azure-first enterprise platform. Ships code into live Java 21 / Spring Boot systems, debugs distributed services across Kubernetes, PostgreSQL, CosmosDB and MongoDB, and drives root-cause analysis on complex production failures. Works entirely in English within a distributed international team, and takes ownership beyond assigned scope, built the team's central engineering reference hub and led vendor-facing knowledge transfer within the first review period.

TECHNICAL SKILLS

Backend: Java 21, Spring Boot, Spring Security, Spring Data JPA, REST APIs, SQL

Cloud & DevOps: Microsoft Azure (App Services, Key Vault), Kubernetes / AKS, Docker, Azure DevOps (pipelines, boards), GitHub Actions, CI/CD

Databases: PostgreSQL, MongoDB, Azure CosmosDB

Frontend: Angular, TypeScript, RxJS

Tools & Monitoring: Maven, Git, Swagger / OpenAPI, Grafana, JUnit 5, Mockito, IntelliJ IDEA

Domain: Enterprise master-data management, GS1 / GDSN product-data standards, ITIL incident & problem management

Languages: Ukrainian (Native), Polish (C1), English (B2, daily working language), German (A2)

PROFESSIONAL EXPERIENCE

Java Engineer — Development & Production Support

May 2026 – Present

Cloudfide · Remote, Poland

Delivered Java 21 / Spring Boot changes to an enterprise product master-data platform, and stabilised failing Azure DevOps build pipelines by resolving class-dependency and test-execution faults that were blocking pull requests for the entire development team.

- **Led root-cause analysis on complex production failures** across four business-critical systems — reproducing issues locally, implementing and deploying fixes, and specifying the application changes delivered by the development team.
- **Built the team's central engineering reference hub** on own initiative — consolidating environments, repositories, health checks, service levels and onboarding material for all four systems into a single source of truth, adopted as the team standard.
- **Led knowledge transfer to an incoming vendor team** during a client-side transition: designed and delivered training sessions on GDSN / GS1 product-data integration and authored the consolidated validation-rules reference used by the team.
- **Ran technical calls** directly with international business stakeholders in English, translating complex system behaviour into clear resolutions and accelerating case turnaround.

Angular / Full-Stack Developer

Feb 2026 – May 2026

USENSE · Angular, TypeScript, Spring Boot, REST APIs, Git

- Modernised a large enterprise web application by migrating legacy AngularJS components to a current Angular architecture.
- Delivered feature enhancements and resolved production defects in a live system, improving frontend structure and long-term maintainability.
- Integrated REST APIs alongside backend engineers to keep behaviour consistent across services.

PROJECTS

Anonymous Feedback Bot — Java, Spring Boot, PostgreSQL, Gemini API, Google Sheets API, Trello API

- Commercial Telegram bot for an auto-service business: integrated the Gemini API for automated sentiment and urgency analysis, engineered data synchronisation to Google Sheets and Trello for management alerts, and built a role-based admin panel for filtering feedback by employee and branch.

EDUCATION

Opole University of Technology, Poland — Computer Science

2024 – Present

National University "Lviv Polytechnic", Ukraine — Computer Science

2023 – 2024

I hereby consent to the processing of my personal data for the purposes of the recruitment process in accordance with GDPR.
